Worlds First Continuous Dictation on a Mobile Phone Available on the Samsung Flipper U720

Product Description: VoiceSignal's VSuite speaker independent speech recognition software and VoiceSignal's VoiceMode speech-to-text dictation solution will be shipped on the Samsung Flipper U720.

VSuite 2.1: VSuite is VoiceSignal's latest voice dialing command and control application. Because it is speaker independent, it does not require any training. VSuite allows the user to lookup contact information, dial any name or number in the contact list, address text messages and pictures, digit dial any number and access features on the phone in a single verbal command.

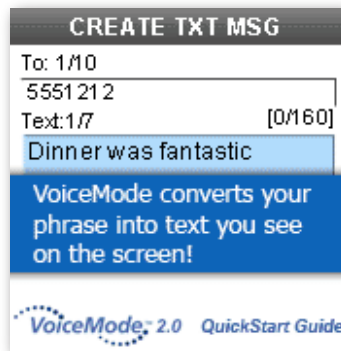

VoiceMode™ 2.0 Delivers true large vocabulary, continuous dictation running entirely embedded in the mobile device. VoiceMode 2.0 is fast and accurate and can be used to input text into any application running on the U720 including email, SMS, IM, and more.

Why Bother: You will never have to use the keypad again! The Flipper will be the first phone to contain VoiceSignal's VoiceMode 2.0, which allows users to fluently (no pauses) dictate a text message with their voice.

Who Cares: All mobile users looking for the ease and convenience of the most advanced speech recognition technology in the world.

In the text messaging application the user presses the dedicated speech key on the Flipper phone...

The Flipper with VoiceSignal's VSuite and VoiceMode 2.0 technology will be available in early 2007.
