SolidDrive SD1

Typically \$500-\$550 per channel plus installation

First retail availability 11/1/06

SolidDrive™ is a powerful patent-pending sound transducer that transmits acoustical energy through almost any solid surface. The entire surface becomes a speaker delivering high-quality sound with the frequency response of conventional diaphragm speakers. SolidDrive™ works with most rigid surfaces including glass, drywall, granite, metal, wood, ceramics, laminates and composites. SolidDrives can be mounted in a wall, under a table or just placed on any surface to create unexpectedly great sound. Because the SolidDrive utilizes materials already existing in a room, it's ideal for installed home audio, commercial audio, or a home theater sound system, all without seeing any speakers.

Who Cares? Any homeowner or business owner that would like high impact sound without visible speakers.

Why Bother? Because the SolidDrive™ utilizes materials already existing in a room, you can create high quality sound on almost any surface you choose.
